## CHEMISTRY 142 - Example Problems

## Solutions and Colligative Properties

To be taken up in class or solutions will be posted

| $\mathrm{N}_{\mathrm{A}}=6.022 \times 10^{23}$ | $\mathrm{~K}_{\mathrm{f}}($ benzene $)=4.90^{\circ} \mathrm{C} \mathrm{kg} / \mathrm{mol}$ | $\mathrm{K}_{\mathrm{f}}($ ethanol $)=1.99^{\circ} \mathrm{C} \mathrm{kg} / \mathrm{mol}$ |
| :--- | :--- | :--- |
| density of $\mathrm{H}_{2} \mathrm{O}=1.00 \mathrm{~g} / \mathrm{mL}$ | $\mathrm{K}_{\mathrm{f}}\left(\mathrm{CCl}_{4}\right)=31.8{ }^{\circ} \mathrm{C} \mathrm{kg} / \mathrm{mol}$ | $\mathrm{K}_{\mathrm{b}}\left(\mathrm{H}_{2} \mathrm{O}\right)=0.51{ }^{\circ} \mathrm{C} \mathrm{kg} / \mathrm{mol}$ |
| $\mathrm{K}_{\mathrm{f}}\left(\mathrm{H}_{2} \mathrm{O}\right)=1.86^{\circ} \mathrm{C} \mathrm{kg} / \mathrm{mol}$ | $\mathrm{K}_{\mathrm{f}}($ acetic acid $)=3.90{ }^{\circ} \mathrm{C} \mathrm{kg} / \mathrm{mol}$ | $\mathrm{P}^{\circ}\left(\mathrm{H}_{2} \mathrm{O}\right)=23.800$ torr at $25^{\circ} \mathrm{C}$ |
| $\mathrm{K}_{\mathrm{b}}(2-$ methyl-2-propanol $)=1.98^{\circ} \mathrm{C} \mathrm{kg} \mathrm{mol}$ |  |  |

1. Show that for very dilute solutions, molality $\cong$ Molarity.
2. Which will experience a greater freezing point depression, a 0.1 m solution of benzene in carbon tetrachloride or a 0.1 m solution carbon tetrachloride in benzene? Explain.
[benzene in $\mathrm{CCl}_{4}$ ]
3. An aqueous sucrose $\left(\mathbf{C}_{\mathbf{1 2}} \mathbf{H}_{22} \mathbf{O}_{11}\right)$ solution of unknown concentration is found to have a freezing point of $-0.912^{\circ} \mathrm{C}$. What is the normal boiling point and the partial pressure (in torr) of water at $25^{\circ} \mathrm{C}$ of this solution. Sucrose is a non-volatile, non-electrolyte.

$$
\left[B P=100.25^{\circ} \mathrm{C} ; P_{\mathrm{H} 2 \mathrm{O}}=23.59 \mathrm{torr}\right]
$$

4. Pure 2-methyl-2-propanol has a freezing point of $25.50^{\circ} \mathrm{C}$, however it absorbs water (as an impurity) on exposure to humid air. If the freezing point of a 100.0 g sample of 2-methyl-2-propanol is $24.59^{\circ} \mathrm{C}$, how many grams of water are present in the sample?

$$
\left[0.35 \mathrm{~g} \mathrm{H}_{2} \mathrm{O}\right]
$$

5. Osmotic pressure is a colligative property that can be used to determine the molar mass of an unknown substance. The osmotic pressure is determined by measuring the height of the column of solution and converting this value to mm of $\mathrm{Hg}(1 \mathrm{~mm} \mathrm{Hg}=1$ torr, 760 torr $=1 \mathrm{~atm}$ ). Using, $\Pi \mathrm{V}_{\text {solution }}=n_{\text {solute }} \mathrm{R} \mathrm{T}$ (where $\Pi$ is the osmotic pressure, R is the universal gas constant and T is the Kelvin temperature), calculate the molar mass of insulin if 20.0 mg is dissolved in 10.0 mL of solution to give a resulting osmotic pressure of 6.48 torr at $25^{\circ} \mathrm{C}$.
[5740 g/mol]
6. Henry's Law constant for most gases decreases with increased temperature. Given that $\mathrm{K}_{\mathrm{H}}$ for $\mathbf{O}_{\mathbf{2}}$ is $2.20 \times 10^{-3} \mathrm{M} \mathrm{atm}^{-1}$ at $5^{\circ} \mathrm{C}$, calculate the percent $\mathbf{O}_{\mathbf{2}}(\mathrm{aq})$ saturation if a lake water sample at $5^{\circ} \mathrm{C}$ and sea-level is found to contain, $9.20 \mathrm{mg} / \mathrm{L}$ of $\mathbf{O}_{\mathbf{2}}(\mathrm{aq})$. (Recall: partial pressure of $\mathbf{O}_{\mathbf{2}}$ at sea-level $=0.2095 \mathrm{~atm}$ ).
[62.3 \% sat ${ }^{d}$ ]
7. An Okanagan vintner (that's a winemaker) is waiting for her grapes to freeze in order to make a special batch of holiday ice-wine. Recent analysis has shown that the grapes are currently $28 \%$ sugar by mass. Assuming that sugar (formula $\mathbf{C}_{6} \mathbf{H}_{\mathbf{1 2}} \mathbf{O}_{6}$ ) is the only solute present and that water is the solvent, at what temperature will the grapes freeze?
$\left[-4.0^{\circ} \mathrm{C}\right]$
8. Calculate the van't Hoff factor $(i)$ for $\mathbf{H F}$ if the freezing point of a 0.50 m aqueous solution has a freezing point of $-1.00^{\circ} \mathrm{C}$. What percentage of the HF is dissociated at this concentration.

$$
\left[i=1.07_{5} ; 3.8 \% \text { diss }\right]
$$
