

Question 1 [12 points]: Evaluate the following limits, if they exist. If a limit does not exist because it is $\pm\infty$, state which it is and include an explanation of your reasoning. You may use the fact that $\lim_{x \rightarrow 0} \frac{\sin x}{x} = 1$.

$$(a) \lim_{x \rightarrow -5} \frac{x^2 + 3x - 10}{x^2 + 8x + 15} = \lim_{x \rightarrow -5} \frac{(x+5)(x-2)}{(x+5)(x+3)} = \frac{-7}{-2} = \boxed{\frac{7}{2}}$$

$$(b) \lim_{x \rightarrow 9} \frac{4 - \sqrt{x+7}}{9-x} \cdot \frac{4 + \sqrt{x+7}}{4 + \sqrt{x+7}} = \lim_{x \rightarrow 9} \frac{16 - (x+7)}{(9-x)(4 + \sqrt{x+7})}$$

$$= \lim_{x \rightarrow 9} \frac{(9-x)}{(9-x)(4 + \sqrt{x+7})}$$

$$= \boxed{\frac{1}{8}}$$

$$(c) \lim_{x \rightarrow 0} \frac{\tan(2x) + 3x}{\sin(2x)} = \lim_{x \rightarrow 0} \frac{\left(\frac{\sin(2x)}{\cos(2x)} + 3x\right)}{\sin(2x)} \quad \div 2x$$

$$= \lim_{x \rightarrow 0} \frac{\frac{\sin(2x)}{2x} \cdot \frac{1}{\cos(2x)} + \frac{3x}{2x}}{\frac{\sin(2x)}{2x}}$$

$$= \frac{1 \cdot 1 + \frac{3}{2}}{1} = \boxed{\frac{5}{2}}^{2x}$$

$$(d) \lim_{x \rightarrow 2^-} \frac{-4}{x^2 - x - 2}$$

$$= \lim_{x \rightarrow 2^-} \frac{-4}{\underbrace{(x-2)}_{\rightarrow 0^-} \underbrace{(x+1)}_{\rightarrow 3^-}} = \boxed{+\infty}$$

Question 2 [8 points]: Consider the function $f(x) = x^3 - 2x^2 - 1$.

(a) Find an equation of the tangent line to the graph of $f(x)$ at $x = -2$.

$$f(x) = x^3 - 2x^2 - 1 \quad ; \quad f(-2) = (-2)^3 - 2(-2)^2 - 1 = -17$$

$$f'(x) = 3x^2 - 4x \quad ; \quad f'(-2) = 3(-2)^2 - 4(-2) = 20$$

$$\therefore y - (-17) = 20(x - (-2))$$

$$y + 17 = 20(x + 2)$$

$$\underline{y} = 20x + 23$$

(b) Find the x -value(s) where the tangent line to the graph of $f(x)$ is parallel to the line $y = 4x - 2$.

$$\text{Solve } f'(x) = 4$$

$$3x^2 - 4x = 4$$

$$3x^2 - 4x - 4 = 0$$

$$3x^2 - 6x + 2x - 4 = 0$$

$$3x(x - 2) + 2(x - 2) = 0$$

$$(3x + 2)(x - 2) = 0$$

$$3x + 2 = 0 \quad , \quad x - 2 = 0$$

$$x = -\frac{2}{3} \quad , \quad x = 2$$

Question 3 [15 points]: Differentiate the following functions (you do not have to simplify your answers):

(a) $y = 4 \ln(3x^4 - 5x^2)$

$$y' = \frac{4}{3x^4 - 5x^2} \cdot (12x^3 - 10x)$$

(b) $y = \frac{e^x - x}{x^2 + \sin x}$

$$y' = \frac{(x^2 + \sin x)(e^x - 1) - (e^x - x)(2x + \cos x)}{(x^2 + \sin x)^2}$$

(c) $y = 5^x \sec x$

$$y' = (5^x \ln 5) \sec x + 5^x (\sec x \tan x)$$

(d) $y = \left(5x^3 - \frac{7}{x^2}\right) e^{\cos x} = (5x^3 - 7x^{-2}) e^{\cos x}$

$$y' = (15x^2 + 14x^{-3}) e^{\cos x} + (5x^3 - 7x^{-2}) e^{\cos x} (-\sin x)$$

(e) $y = \tan(\sqrt{x^3 - \log_5 x})$

$$y' = \sec^2(\sqrt{x^3 - \log_5 x}) \cdot \frac{1}{2} (x^3 - \log_5 x)^{-\frac{1}{2}} \cdot \left(3x^2 - \frac{1}{x \ln 5}\right)$$

Question 4 [5 points]: Use the definition of the derivative to find $f'(x)$ for $f(x) = \frac{3}{x+7}$. (A score of 0 will be given if $f'(x)$ is found using the differentiation rules.)

$$f'(x) = \lim_{h \rightarrow 0} \frac{f(x+h) - f(x)}{h}$$

$$= \lim_{h \rightarrow 0} \frac{1}{h} \left[\frac{3}{x+h+7} - \frac{3}{x+7} \right]$$

$$= \lim_{h \rightarrow 0} \frac{1}{h} \left[\frac{\cancel{3x} + 3h - \cancel{3x} - 3h + 21}{(x+h+7)(x+7)} \right]$$

$$= \lim_{h \rightarrow 0} \frac{1}{h} \cdot \frac{-3h}{(x+h+7)(x+7)}$$

$$= \frac{-3}{(x+7)^2}$$

Question 5 [10 points]:

(a) Use implicit differentiation to find $\frac{dy}{dx}$ for $e^{xy^2} = 4x^2 - \cos y$.

$$\frac{d}{dx} [e^{xy^2}] = \frac{d}{dx} [4x^2 - \cos y]$$

$$e^{xy^2} \cdot [y^2 + 2xyy'] = 8x + \sin y \cdot y'$$

$$y^2 e^{xy^2} + 2xy e^{xy^2} y' = 8x + \sin y \cdot y'$$

$$y' [2xy e^{xy^2} - \sin y] = 8x - y^2 e^{xy^2}$$

$$y' = \frac{8x - y^2 e^{xy^2}}{2xy e^{xy^2} - \sin y}$$

(b) Use logarithmic differentiation to find $\frac{dy}{dx}$ for $y = \frac{\sin^{10} x}{7^{x^2-4x+1}}$.

$$\ln y = \ln \left[\frac{(\sin x)^{10}}{7^{x^2-4x+1}} \right]$$

$$\ln y = 10 \ln(\sin x) - (x^2 - 4x + 1) \ln 7$$

$$\frac{1}{y} y' = \frac{10}{\sin x} \cdot \cos x - (2x - 4) \ln 7$$

$$\therefore y' = \frac{\sin^{10} x}{7^{x^2-4x+1}} \left[\frac{10 \cos x}{\sin x} - (2x - 4) \ln 7 \right]$$

$$\text{or } y' = \frac{\sin^{10} x}{7^{x^2-4x+1}} \left[10 \cot x - \ln(7^{2x-4}) \right]$$

Question 6 [10 points]:

(a) Find the general antiderivative for each of the following functions:

(i) $f(x) = -\sec^2 x - 4 \sin x + 7e^x$

$$F(x) = -\tan x + 4 \cos x + 7e^x + C$$

(ii) $f(x) = \frac{3x^6 - 4x + 2\sqrt[3]{x^3}}{x^2} = 3x^4 - 4\left(\frac{1}{x}\right) + 2x^{-\frac{5}{4}}$

$$F(x) = \frac{3x^5}{5} - 4 \ln|x| + 2 \frac{x^{-\frac{1}{4}}}{(-\frac{1}{4})} + C$$

$$= \frac{3}{5}x^5 - 4 \ln|x| - 8x^{-\frac{1}{4}} + C$$

(b) Find the function $g(t)$ such that $g'(t) = 5t^4 + 9t^2$ and $g(-1) = 7$.

$$g(t) = \frac{5t^5}{5} + \frac{9t^3}{3} + C$$

$$= t^5 + 3t^3 + C$$

$$g(-1) = 7 \Rightarrow 7 = (-1)^5 + 3(-1)^3 + C$$

$$7 = -1 - 3 + C$$

$$C = 11$$

$$\therefore g(t) = t^5 + 3t^3 + 11$$

Question 7 [10 points]: The graph of $f'(x)$ is shown below (note this is the graph of $f'(x)$, not $f(x)$):

(a) On what interval(s) is f decreasing?

$$f'(x) < 0 \Rightarrow f \text{ decreasing,}$$

$$\therefore (-\infty, b) \cup (p, 0)$$

(b) At what x -value(s) does $f(x)$ have local minima?

$$f' \text{ changing from negative to positive} \Rightarrow \text{local min.}$$

$$\therefore x = b, x = 0$$

(c) On what interval(s) is the graph of $f(x)$ concave up?

$$f' \text{ increasing} \Rightarrow f'' > 0 \Rightarrow f \text{ concave up.}$$

$$\therefore (-\infty, c) \cup (q, r) \cup (s, t)$$

(d) At what x -value(s) does the graph of $f(x)$ have inflection points?

$$f' \text{ changing from increasing to decreasing (or vice versa)} \\ \Rightarrow \text{inflection point}$$

$$\therefore x = c, x = q, x = r, x = s$$

(e) At what x -value(s) does $f''(x)$ not exist?

$$x = r, x = t.$$

Question 8 [5 points]: You have completed the analysis of a function $f(x)$ and found the information listed below. Sketch the graph of $y = f(x)$.

- The domain of $f(x)$ is $(-\infty, 2), (2, \infty)$.
- $f(x)$ has the following function values:

x	-6	-3	-1	0	3	5	9
$f(x)$	-2	0	3	5	0	2	-1

- $\lim_{x \rightarrow \infty} f(x) = -3$, $\lim_{x \rightarrow -\infty} f(x) = \infty$ ✓
- $\lim_{x \rightarrow 2} f(x) = -\infty$ ✓
- $f'(-6) = f'(0) = f'(5) = 0$ ✓
- $f'(x) > 0$ on $(-6, 0)$ and $(2, 5)$ ✓
- $f'(x) < 0$ on $(-\infty, -6)$, $(0, 2)$ and $(5, \infty)$ ✓
- $f''(-1) = f''(9) = 0$ ✓
- $f''(x) > 0$ on $(-\infty, -1)$ and $(9, \infty)$
- $f''(x) < 0$ on $(-1, 2)$ and $(2, 9)$

Question 9 [12 points]: The function $f(x) = \frac{x}{x^2+1}$ has $f'(x) = \frac{1-x^2}{(x^2+1)^2}$ and $f''(x) = \frac{2x(x^2-3)}{(x^2+1)^3}$.

(a) Find the intervals on which $f(x)$ is increasing or decreasing.

$$f'(x) = \frac{1-x^2}{(x^2+1)^2} = 0 \text{ at } x = 1, -1$$

	-1	1	
	⊖	⊕	⊖
$f'(x) = \frac{1-x^2}{(x^2+1)^2}$:	-	0	+
	0	0	-
$f(x) = \frac{x}{x^2+1}$:	↘	↗	↘
	$-\frac{1}{2}$	$\frac{1}{2}$	

∴ f is increasing on $(-1, 1)$, decreasing on $(-\infty, -1) \cup (1, \infty)$.

(b) Find the local maximum and minimum values of $f(x)$.

f has a local minimum of $-\frac{1}{2}$ at $x = -1$.

f has a local maximum of $\frac{1}{2}$ at $x = 1$.

(c) Find the intervals on which $f(x)$ is concave up or concave down.

$$f''(x) = \frac{2x(x^2-3)}{(x^2+1)^3} = 0 \text{ at } x = 0, \sqrt{3}, -\sqrt{3}$$

	-√3	0	√3	
	⊖	⊕	⊖	⊕
$f''(x) = \frac{2x(x^2-3)}{(x^2+1)^3}$:	-	0	+	0
	-	-	-	+
$f(x) = \frac{x}{x^2+1}$:	∩	∪	∩	∪
	$-\frac{\sqrt{3}}{4}$	0	$\frac{\sqrt{3}}{4}$	

∴ f is concave up on $(-\sqrt{3}, 0) \cup (\sqrt{3}, \infty)$;
 concave down on $(-\infty, -\sqrt{3}) \cup (0, \sqrt{3})$.

(d) Find the inflection points of $f(x)$.

$$\left(-\sqrt{3}, -\frac{\sqrt{3}}{4}\right), (0, 0), \left(\sqrt{3}, \frac{\sqrt{3}}{4}\right).$$

Question 10 [8 points]: A straight wire is 60 cm long. The wire is bent into the shape of an L, where the bend forms a right angle. What is the shortest possible distance between the two ends of the bent wire?

$$l(x) = [x^2 + (60-x)^2]^{\frac{1}{2}}, \quad 0 \leq x \leq 60$$

$$l'(x) = \frac{1}{2} [x^2 + (60-x)^2]^{-\frac{1}{2}} [2x + 2(60-x)(-1)]$$

$$= \frac{4x - 120}{2\sqrt{x^2 + (60-x)^2}}$$

$$= \frac{2x - 60}{\sqrt{x^2 + (60-x)^2}}$$

- $l'(x) = 0$ at $x = 30$
- $l'(x)$ not exist? no such x .

x	$l(x) = \sqrt{x^2 + (60-x)^2}$
0	60
30	$\sqrt{30^2 + 30^2} = 30\sqrt{2}$
60	60

∴ The shortest possible distance is $30\sqrt{2}$ cm.

Question 11 [10 points]: Two ships, the Erebus and the Terror, are sailing the high seas in search of the Northwest Passage. At 6:00 am, the Erebus is 30 km north of the Terror. The Erebus is sailing west at 8 km/hr and the Terror is sailing east at 12 km/hr. How fast is the distance between the ships changing at 8:00 am?

Let $u = x + y$, so $\frac{du}{dt} = 20 \frac{\text{km}}{\text{h}}$:

Find $\frac{dl}{dt}$ when $u = (2)(8) + (2)(12) = 40$.

$$l = [30^2 + u^2]^{\frac{1}{2}}$$

$$\frac{dl}{dt} = \frac{1}{2} [30^2 + u^2]^{-\frac{1}{2}} [2u \frac{du}{dt}]$$

when $u = 40$:

$$\begin{aligned} \frac{dl}{dt} &= \frac{1}{2} [30^2 + 40^2]^{-\frac{1}{2}} [2 \cdot 40 \cdot 20] \\ &= \frac{800}{50} = 16 \frac{\text{km}}{\text{h}} \end{aligned}$$

∴ Distance between ships is increasing by $16 \frac{\text{km}}{\text{h}}$.

Question 12 [10 points]: A cylindrical can with a bottom but no top is to be made from 300π square meters of aluminum. Find the largest possible volume of such a can. (Note that the volume of cylinder is $V = \pi r^2 h$.)

$$V = \pi r^2 h$$

$$S = \pi r^2 + 2\pi r h = 300\pi$$

Maximize $V = \pi r^2 h$

subject to $\pi r^2 + 2\pi r h = 300\pi$

$$\pi r^2 + 2\pi r h = 300\pi$$

$$h = \frac{300\pi - \pi r^2}{2\pi r} = \frac{300 - r^2}{2r}$$

$$\therefore V(r) = \pi r^2 \left[\frac{300 - r^2}{2r} \right] = \frac{\pi}{2} r (300 - r^2)$$

$$V'(r) = \frac{\pi}{2} [300 - r^2 + r(-2r)]$$

$$= \frac{\pi}{2} [300 - 3r^2]$$

$$V'(r) = 0 \Rightarrow 300 - 3r^2 = 0$$

$$\therefore r = \pm \sqrt{\frac{300}{3}} = 10$$

↑ since $r > 0$.

$$V'(r) = \frac{\pi}{2} [300 - 3r^2]: \quad + \quad 0 \quad -$$

$$V(r) = \frac{\pi}{2} r(300 - r^2): \quad \nearrow \quad 1000\pi \quad \searrow$$

\therefore The largest possible volume is $1000\pi \text{ m}^3$.

Question 13 [5 points]: Consider the function $f(x) = ax^3 + bx^2 + c$. Find the values of a , b and c so that $(-1, 0)$ is a point on $f(x)$ and so that $f(x)$ has a point of inflection at $(1, 1)$.

$$f(-1) = 0 \Rightarrow -a + b + c = 0 \quad \textcircled{1}$$

$$f(1) = 1 \Rightarrow a + b + c = 1 \quad \textcircled{2}$$

$$f''(1) = 0 \Rightarrow \left. \frac{d}{dx} [3ax^2 + 2bx] \right|_{x=1} = 0$$

$$\Rightarrow \left. 6ax + 2b \right|_{x=1} = 0$$

$$6a + 2b = 0 \quad \textcircled{3}$$

$$\textcircled{1} - \textcircled{2} : -2a = -1$$

$$\therefore \boxed{a = \frac{1}{2}}$$

$$\text{using } \textcircled{3} : 6\left(\frac{1}{2}\right) + 2b = 0$$

$$\boxed{b = -\frac{3}{2}}$$

$$\text{using } \textcircled{2} : \frac{1}{2} - \frac{3}{2} + c = 1$$

$$c = 1 + \frac{3}{2} - \frac{1}{2}$$

$$\boxed{c = 2}$$
