Derivative Rules

Assumptions

In the following, suppose:

- c represents a constant (a fixed number)
- The functions f(x) and g(x) are both differentiable. That is,

$$f'(x) = \lim_{h \to 0} rac{f(x+h) - f(x)}{h}$$
 and $g'(x) = \lim_{h \to 0} rac{g(x+h) - g(x)}{h}$

both exist

Constant Rule

$$\quad \stackrel{d}{=} \frac{d}{dx} [c] = 0$$

In words: The derivative of a constant is zero

• Example:
$$\frac{d}{dx}\left[\sqrt{2\pi}\right] = 0$$

• Proof: let
$$f(x) = c$$
. Then

$$\frac{d}{dx}[c] = f'(x) = \lim_{h \to 0} \frac{f(x+h) - f(x)}{h} = \lim_{h \to 0} \frac{c-c}{h} = \lim_{h \to 0} \frac{0}{h} = 0$$

Power Rule

• If *n* is any real number, $\frac{d}{dx}[x^n] = nx^{n-1}$

• Example:
$$\frac{d}{dx}\left[x^{11}\right] = 11x^{10}$$

▶ Proof (in the case where *n* is a positive integer): let $f(x) = x^n$.

$$\frac{d}{dx} [x^n] = \lim_{h \to 0} \frac{f(x+h) - f(x)}{h}$$

$$= \lim_{h \to 0} \frac{(x+h)^n - x^n}{h}$$

$$= \lim_{h \to 0} \frac{x^n + nx^{n-1}h + (\text{terms with factor of } h^2) + \dots - x^n}{h}$$

$$= \lim_{h \to 0} nx^{n-1} + (\text{terms with factor of } h)$$

$$= nx^{n-1}$$

Power Rule, case n = 1

$$\quad \bullet \ \frac{d}{dx}[x] = 1$$

• Why?
$$\frac{d}{dx}\left[x^{1}\right] = 1 \cdot x^{0} = 1$$

Constant Multiple Rule

$$\frac{d}{dx} [c \cdot f(x)] = c \cdot \frac{d}{dx} [f(x)]$$

In words: The derivative of a constant times a function is the constant times the derivative of the function

Constant Multiple Rule

Proof of Constant Multiple Rule:

$$\frac{d}{dx} [c \cdot f(x)] = \lim_{h \to 0} \frac{c \cdot f(x+h) - c \cdot f(x)}{h}$$
$$= \lim_{h \to 0} c \cdot \frac{f(x+h) - f(x)}{h}$$
$$= c \cdot \lim_{h \to 0} \frac{f(x+h) - f(x)}{h}$$
$$= c \cdot \frac{d}{dx} [f(x)]$$

• Example:
$$\frac{d}{dx} \left[3x^{11} \right] = 3 \cdot \frac{d}{dx} \left[x^{11} \right] = 3(11x^{10}) = 33x^{10}$$

Sum Rule

$$\frac{d}{dx} \left[f(x) + g(x) \right] = \frac{d}{dx} \left[f(x) \right] + \frac{d}{dx} \left[g(x) \right]$$

In words: The derivative of a sum is the sum of the derivatives

Sum Rule

Proof of the Sum Rule:

$$\frac{d}{dx} [f(x) + g(x)] \\
= \lim_{h \to 0} \frac{[f(x+h) + g(x+h)] - [f(x) + g(x)]}{h} \\
= \lim_{h \to 0} \frac{[f(x+h) - f(x)] + [g(x+h) - g(x)]}{h} \\
= \lim_{h \to 0} \left(\frac{f(x+h) - f(x)}{h} + \frac{g(x+h) - g(x)}{h} \right) \\
= \lim_{h \to 0} \frac{f(x+h) - f(x)}{h} + \lim_{h \to 0} \frac{g(x+h) - g(x)}{h} \\
= \frac{d}{dx} [f(x)] + \frac{d}{dx} [g(x)]$$

Difference Rule

$$d_{dx} [f(x) - g(x)] = \frac{d}{dx} [f(x)] - \frac{d}{dx} [g(x)]$$

In words: The derivative of a difference is the difference of the derivatives

Example:

$$\frac{d}{dx} \left[x^3 - 2x^{1/2} + \frac{x}{2} \right] = \frac{d}{dx} \left[x^3 \right] - \frac{d}{dx} \left[2x^{1/2} \right] + \frac{d}{dx} \left[\frac{1}{2}x \right]$$
$$= 3x^2 - 2\frac{d}{dx} \left[x^{1/2} \right] + \frac{1}{2} \frac{d}{dx} \left[x \right]$$
$$= 3x^2 - 2(\frac{1}{2}x^{-1/2}) + \frac{1}{2}(1)$$
$$= 3x^2 - x^{-1/2} + \frac{1}{2}$$

Sine and Cosine Rule

•
$$\frac{d}{dx}[\sin(x)] = \cos(x)$$

$$\quad \bullet \ \frac{d}{dx}\left[\cos\left(x\right)\right] = \ -\sin\left(x\right)$$

Example:

$$\frac{d}{dx}\left[4\cos\left(x\right) + \frac{\sin\left(x\right)}{\pi}\right] = 4\frac{d}{dx}\left[\cos\left(x\right)\right] + \frac{1}{\pi}\frac{d}{dx}\left[\sin\left(x\right)\right]$$
$$= -4\sin\left(x\right) + \frac{1}{\pi}\cos\left(x\right)$$
